Commit: 3bf462d — Improve portfolio UX, error screens, and console display stability.

ye kesy fix kita ye reflection ni tgi toh kiya tha

Bottom wali “reflection” typed text ka leftover nahi thi.

Asal masla Maximize + hari font pe Windows console

Show more 

Bilkul basic level se samjho:

Issue kya tha?

Tumhari console mein neeche **yellow si reflection/line** nazar aa rahi thi. Aisa lag raha tha jaise `"Enter your choice:"` ka text neeche dobara print ho raha ho.

Lekin text dobara print nahi ho raha tha.

Asal mein console ki **window height** aur **font size** perfectly match nahi kar rahe the.

Example samjho: agar ek text row ko screen par **22 pixels** height chahiye aur console ki available height poori rows ke baad **5 pixels extra** chhor de, to Windows neeche next row ke sirf woh **5 pixels** bhi dikha deta hai.

Yani:

```
| Main Menu |
|          |
| Enter your choice: |
|          |
|_____|
| ^ next row ka thora sa | ← yellow reflection jaisa
```

Ye **aadhi/partial console row** thi, reflection nahi.

Fix kaise hua?

Code mein basically console ko kaha gaya:

Window ki height aisi rakho ke sirf **complete text rows** fit hon. Agar end mein kuch extra pixels bach rahe hain, unko window height se hata do.

Isko **font-grid snapping** keh sakte ho.

Phir extra safety ke liye prompt ke neeche ka area **blank black spaces se clear** kiya gaya. Isliye agar koi purana yellow character buffer mein ho bhi, woh neeche se peek nahi karta.

Aur font **24** → **22** kiya gaya, jis se maximize screen mein rows aur cleanly fit hone lag gayin.

Ek line mein

Problem: Console ki height font ki row-height ka exact multiple nahi thi → neeche next text row ka chhota sa hissa dikh raha tha → reflection lag rahi thi.

Solution: Console height ko complete font rows ke according adjust kiya + bottom area black clear kiya + font 22 kiya.

So ye **printing/code duplication ka bug nahi**, balki **Windows Console rendering/sizing issue** tha.

smjh ni ayi k wo extra q chor rhi or is sa ye kiya mtlb

Haan, **“extra pixels kyun bach rahe thay?”** yehi main point hai. Isko screen example se samjho.

Maan lo tumhari maximized console ko Windows ne **1000 pixels height** di.

Ab tumhare console font ki **har text row**, maan lo, **22 pixels** leti hai.

To Windows calculate karta hai:

$$1000 \div 22 = 45 \text{ complete rows} + 10 \text{ pixels extra}$$

Yani:

```
22 px × 45 rows = 990 px
Screen height   = 1000 px
Extra           =   10 px
```

Ab woh **10 pixels** kisi complete text line ke liye enough nahi hain, kyun ke ek line ko 22 pixels chahiye.

Problem yahan hui

Windows Console ne un 10 pixels ko simply hide nahi kiya. Usne **next text row ka sirf 10-pixel wala hissa** dikha diya.

Suppose next row mein yellow text tha:

```
Enter your choice:
```

Poora text dikhne ke bajaye letters ka **sirf uppermost hissa** dikh raha tha:

```
| Enter your choice: | ← normal row
|                   |
|_____|
| - - - - - | ← next row ke letters ka
|                   |      sirf upper part
```

Tumhein woh neeche **yellow reflection/ghost line** lag rahi thi.

Extra pixels aaye hi kyun?

Kyun ke **Windows window ka size pixels mein decide karta hai**, jabke console ka text **fixed-size rows mein** draw hota hai.

Dono numbers zaroori nahi ke perfectly divide hon.

Bilkul aise jaise tumhare paas **100 cm ki shelf** ho aur har box **22 cm** ka ho:

$$4 \text{ boxes} = 88 \text{ cm}, \text{ aur } 12 \text{ cm bach jayega.}$$

Shelf ne jaan bujh kar 12 cm nahi chhora. Bas **100, 22 se perfectly divide nahi hota**.

Tumhare project mein fix kya hua?

Code ne essentially kaha:

“Jo extra pixels bach rahe hain unko hatao aur console window ko nearest complete text-row par end karo.”

For example:

```
Before:
1000 px
↓
45 complete rows = 990 px
+ 10 px partial row ❌

After:
990 px
↓
45 complete rows exactly ✅
```

Isi ko tumhare explanation mein **“font grid snap”** kaha gaya tha.

Aur font `24` → `22` karne se screen par rows ka fitting aur better ho gaya.

So reflection ko erase karna main fix nahi tha. Main fix ye tha ke console ke bottom par jo next row ka aadha/tukra dikh raha tha, window sizing adjust karke us partial row ko hi hata diya gaya.

wo kesy htaya gya kon sa code use kita gya

Exact code batane ke liye mujhe repo ka current commit dekhna hoga, warna main guess karunga. Tumne commit `3bf462d` diya hai, isliye usi se verify karke bata sakta hoon ke **kaunsi lines ne partial row remove ki** aur har line kya kar rahi hai.
